Role of Teachers in Quality Sustenance and Enhancement of the Students

Dr. Chandrakant R. Mandlik

ABSTRACT

The teacher is the important element in understanding desired objectives and for translating the dreams into realities. The teacher of the post 21st century helps the students to grow according to his abilities, aptitudes and attitudes. He is a remarkable source of motivating the students to experiment and to search out facts for themselves.

Active participation of the students in the teaching learning process is expected without minimizing the teacher's role. It leads to develop 'problem solving approach' on the part of pupils as a strong motive for purposeful learning.

Hence teachers need to acquire media competency in addition to usual instruction skills. The world can be brought into the classroom by the use of media like films, tape-recorders, television, computers and internet. Advantages of internet education consist of new learning opportunities, objectivity in education system, faster and easiest mode of communication.

ROLE OF TEACHER IN QUALITY SUSTENANCE AND ENHANCEMENT

Teachers have to play a very significant role in day today changing educational scenario. The success of constructive future plans depends on the competence of the teacher-his knowledge, understanding, attitude, critical thinking and so on.

intimacy. At the outset quality of learning depends upon the nature of classroom climate. He or she can and should integrate teaching technology when instructional technology becomes greater need. Today's teachers can train the pupils to lead full life in the post 21st century. Hence teachers need to acquire media competency in addition to usual instruction skills. The future of education depends, therefore, directly or indirectly upon inventive minds of teachers and their ability to innovate.

Communication is the unchanging function of the teacher in the communication revolution. In traditional education the teacher had at his command only the spoken or written words as weapons of communication with his students. They listened the teachers and stored it in the memory compartment of the brain which was eternal till the last moment of life. But at present the teacher has at his hand a battery of interrelated media to land securely his students with achievements on the space of learning. The satellite has become a mechanic brain. Consequently, students collect information through 'cut and paste' mechanism in computer. They immediately forget what they have collected. If light switches off the brain also ceases process of storing. Biologically if organ in the body is not used for a long time it stops its functions and becomes wastegial organ.

With the help of new communication media, modern methodology and latest instructional materials, education brings about changes in the society, they are permanent and excelling in nature. In the Western countries education has advanced the background of growing industrialization and highly technological society. As Ottaway has pointed out:

The more advanced technology the greater the need highly specialized man power and hence for a longer school life and a greater provision of higher education. (Mohanty, 1991)

The teacher of today is considered as a creator of stimulating environment. The environment or world can be brought into the classroom by the use of media like films, tape-recorders, television, computers and Internet. It would become popular to bring pupils into active contact with the outside world. They must be encouraged to explore, to ask questions to study themselves and to be creative. Then only, they can realize that they are not passive listeners of dictations in the class-rooms.

Advantages of Internet education consist of new learning opportunities, objectivity in education system, faster and easiest mode of communication. To
